

ESET ENDPOINT SECURITY

Datasheet

www.eset.com

Comprehensive solution for company endpoints with multiple layers of protection of Antivirus, Antispyware, Firewall and Web Control. Remote administration makes oversight of security a snap from a single console.

System Requirements:

Windows® 7, Vista, XP, 2000,
Windows Server 2000, 2003, 2008, 2008 R2

Processor Architecture:

Intel®/AMD® x86/x64

Antivirus and Antispyware

Eliminates all forms of threats, including viruses, rootkits, worms and spyware, keeping your network protected online and off. Optional cloud-powered scanning utilizes our reputation database for increased scanning speed and minimal false positives.

NEW Host-based Intrusion Prevention System (HIPS)

Provides tampering protection and protects the system registry, processes, applications and files from unauthorized modification. You can customize the behavior of the system down to every last detail and detect even unknown threats based on suspicious behavior.

NEW Web Control

Allows to limit access to select website categories by a way of automatic in-the-cloud classification. Create detailed rules for user groups to comply with your company policies and block sites generating high traffic volume.

Trusted Network Detection

Lets you define trusted networks and protect all other connections with strict mode, making company laptops invisible in public Wi-Fi networks in hotels, airports and at conferences.

Two-way Firewall

Prevents unauthorized access to company network and protects company data from exposure. Remote administration provides a firewall rule merge wizard that makes aggregating firewall rules in the network a snap.

Client Antispam

Protects your company communications from spam and email-borne threats. Set white- and blacklists and self-learning separately for each client or group. The antispam natively supports Microsoft Outlook and also filters POP3, IMAP, MAPI and HTTP protocols.

NEW Device Control

Lets you block unauthorized media and devices based on pre-set rules and parameters. Set access permissions (read/write, read, block) for individual media, devices, users and groups.

NEW Component-based Installation

Install any or all of these security components: firewall, antispam, web control, device control, Microsoft NAP support, and web access protection. You can also remotely enable/disable installed modules.

Low System Demands

Ensure proven detection while leaving more system resources for programs you use daily. Our software also runs smoothly on older hardware, saving your time and costs of having to upgrade your endpoints.

NEW Multiple Log Formats

Save logs in common formats - CSV, plain text, or Windows event log for immediate analysis or harvesting. Take advantage of data being readable by 3rd party SIEM tools; RSA enVision is supported directly via a plug-in.
